

It is not exactly easy to sculpt your way to a bigger buttock and get a flat stomach or abs. EMSCULPT brings a completely new approach to body shaping treatment. This **FDA-approved, non-invasive, electromagnetic procedure** is the first and only body sculpting procedure for men and women that **simultaneously builds muscle and burn fat**.

EMSCULPT also creates the world's first **non-invasive butt lift procedure**.

How Does it Work?

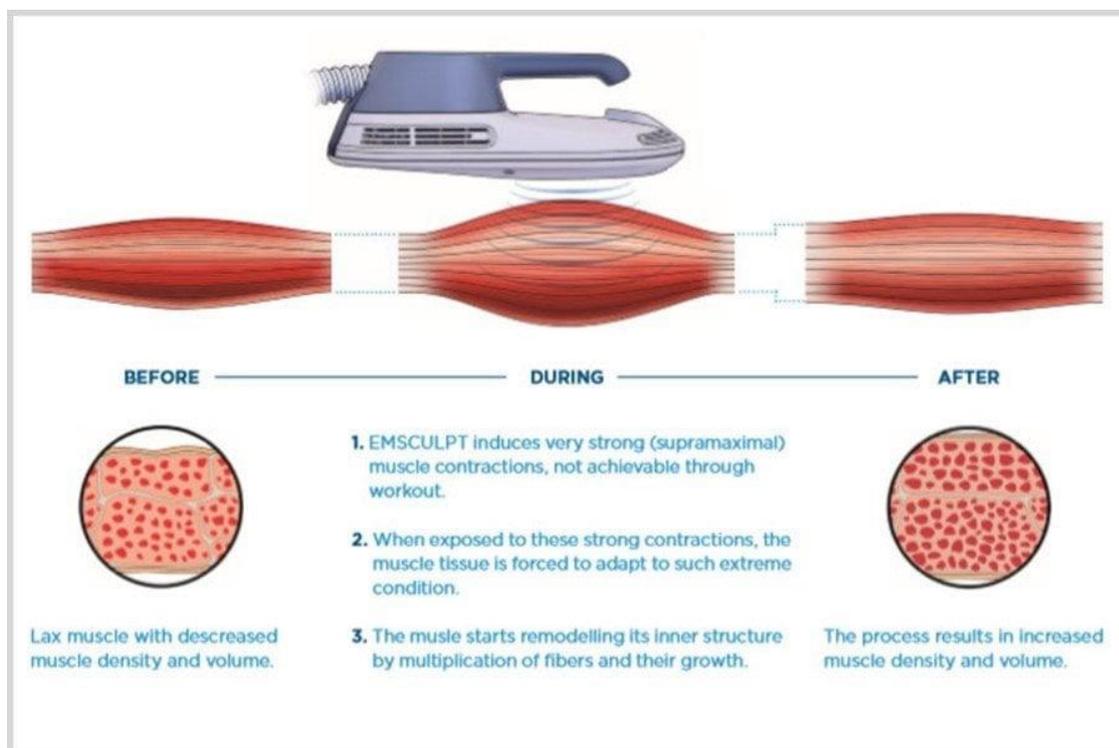

20,000 Supramaximal Muscle Contractions by BTL

EMSCULPT uses a non-invasive HIFEM® (High-Intensity Focused Electromagnetic) technology that penetrates the skin to impact muscle tissue as well as belly fat. The energy induces almost 20,000 supramaximal muscle contractions per session, something that can't be achieved through voluntary contractions (i.e. exercising at the gym.) All this happens while you are lying on a bed during treatment.

EMSCULPT emits electromagnetic pulses targeted to **strengthen your muscle fibers** and **burn unwanted fat**. When muscle tissue is exposed to the high level of supramaximal contractions (approximately 20,000 contractions each treatment), it causes the muscles to release chemicals that tell fat cells in that area to break down. Being forced to adapt, it responds with a deep remodeling of the inner structure that results in muscle building and fat burning.

According to studies done across seven independent multi-centre in the USA, Emsculpt can effectively remove approximately 19% of fat in the treatment area, and at the same time increase muscle mass by 16%.

How long does the treatment take?

A 30 minute session for the abdomen and buttocks and a 20 minute session for Arms & Calves with a minimum of 4 sessions, 2-3 days apart for optimal results. Our trained professionals will advise on a tailored treatment plan, based on the individual's lifestyle and body.

Treatment Areas

EMSCULPT®

Treatment areas include:

- Abdomen
- Arms
- Buttocks
- Calves

EMSCULPT®

FAQs for EMSCULPT Treatment

Is the treatment painful?

EMSCULPT is a virtually pain-free. It is non-invasive, has no downtime and requires no recovery time or any pre/post treatment preparation.

How soon can I see results?

Some patients report a sensation that resembles normal muscle soreness right after the treatment. Clinically tested for safety and efficacy, positive results may be experienced two to four weeks after the last session and will continue to improve for several weeks following the treatment.

Suitable Candidates

EMSCULPT requires good patient selection and accurate diagnostic evaluation. It is not suitable for extremely obese people. EMSCULPT is most suitable for people who are not candidates for fat-freezing treatments like CoolSculpting due to the smaller amounts of fat. Anyone who wants more defined, sculpted abs and glutes can benefit from EMSCULPT.

Emsculpt for Diastasis Recti

EMSCULPT can also help treat Diastasis Recti (post-pregnancy muscle separation) in women. In the past, surgery was the only option for diastasis recti. However, an innovative new non-invasive technology called Emsculpt has the ability to transform the abdomen and significantly improve diastasis recti without surgery, incisions, anesthesia, or downtime.

Benefits of Emsculpt for post-pregnancy:

- Restore core muscle function
- Improve posture and reduce back pain
- Improve pelvic floor dysfunction

Emsculpt is a non-invasive way of strengthening & rebuilding muscle. The result is a firmer, leaner, stronger core and more toned abdomen.
