

## **Perfect Eyes**

Eyes are the windows to the soul, so the saying goes. Besides that, they are one of the most prominent features on the face, and so they always attract attention. However, when we do not have enough rest, we might develop noticeable puffy eye bags, dark eye circles, and other unsightly conditions around our eyes.

We should take extra care of the skin around the eyes, because it is more delicate and thinner. It is one of the first areas where signs of fatigue and ageing are visible.

### **Why Choose PerfectEye?**

Many lifestyle and health issues cause stress and lack of sleep, which lead to the formation of dark eye circles, puffy eyes and eye bags that can make ladies look tired and older than their actual age. The most common causes of dark eye circles and eye bags are lack of sleep, genetics, smoking, drinking alcohol, and ageing.

PerfectEye was specially created to help correct issues with pigmentation, fine and deep lines, dark eye circles, eye bags, puffy eyes and sagging skin.

With a combination of lasers and specialised topical repair serum, PerfectEye helps to repair tissue damage and improve discolouration around the eye area. It also makes it possible for you to get rid of eye bags and dark eye circles, as well as firm and lift up your eyes.

### **How it works?**

In the treatment, a laser is used to strengthen collagen. The laser heats up the deeper layers of the skin to stimulate collagen production, while leaving surrounding tissues around the eyes unharmed. It does this by sending ultra-short bursts of energy in trillionths of a second to fragment particles into really thin 'dust'.

The laser also boosts blood circulation, while gently lightening and reducing pigmentation.

The treatment incorporates youth-boosting stem cell proteins, from umbilical cord lining extract. A type of technology called cryostamp is used to infuse the stem cells, resulting in noticeably lifted and tightened skin.

Through this treatment, the skin's cycle of regeneration is enhanced, and the skin structure surrounding the eyes becomes more elastic and resilient.

### **Safety & Side Effects**

The treatment is non-invasive and non-surgical, and therefore the process is practically pain-free. However, for your comfort, numbing cream may be applied to

lessen any potential discomfort. Usually, no downtime is needed. Patients can usually return to their regular routine after the session.

Every patient is different, so there might be some who will have mild to moderate redness, which could last somewhere between 2 and 7 days. If this occurs, you can apply a thin layer of moisturiser and sunblock. In addition, please avoid exposure to the sun.

**Important note:**

The Ministry of Health of Singapore does not allow the publishing of before and after photographs and patient testimonials in advertising materials. If you visit our clinics for more information, we will be happy to show you more photographs and pictures of our patients.
